Technical Support Bulletin (Last update 3-27-3)

Why can't I use a thick line for my target?

As you make a thick line wider in cad programs they are centered about the middle of the line. When you make the line narrower to cut the target the edge moves back to the center. This offset changes the distance between the target and the shapes being cut.

As you can see the printed target in gray and the cut target in red are at different distances from the cut line. To correct this offset you must create an outline of the target. When printing fill the outline. When cutting don't fill the outline.
